Summary

Fullstack Software Engineer passionate about solving complex problems with elegant solutions. I focus on clean, user-centric design, balancing technical precision with empathy for the end-user. I enjoy crafting intuitive experiences and articulating the "how" and "why" behind design decisions.

Education and Training

- 04/2025 **Ivy Tech Community College of Indiana** Lake County, IN
Associate of Science: Computer Science
- 04/2025 **Ivy Tech Community College of Indiana** Lake County, IN
Associate of Science: Software Development

Links

Skills

- **Languages:** Go, Kotlin, Swift, JavaScript/TypeScript, C++, Java, Python, BrightScript, HTML & CSS
- **Mobile:** SwiftUI, UIKit, Jetpack Compose, XML, KMM (Kotlin Multiplatform Mobile)
- **Web:** React, Solid, jQuery
- **Backend:** REST, GraphQL, Websockets, Firebase, SQL, Postgres, MongoDB, Fiber, Echo, Gin
- **Architecture & Patterns:** MVVM, MVC, MVI, MVP, Clean Architecture, SOLID, Factory, Observer, Builder, Strategy, Mediator
- **Tools and Platforms:** Google Cloud, Azure, AWS, Stripe, Firebase
- **Testing & DI:** Unit/Integration Testing, Dagger, Hilt, Koin, Swinject
- **API Documentation:** Swagger, OpenAPI

Experience

- 08/2022 - Current **The Christian Broadcasting Network** — Virginia Beach, VA
Mobile Developer II
- Lead Mobile Developer and Architect on CBN Bible Mobile (Android and iOS). I designed and developed a clean architecture with use cases and MVVM design, backed by SOLID principles for mobile (Android, iOS, and SDK). I solved various backend problems, i.e., dynamic data mapping for reading plan days.
 - Built internal tools, a USX tagging website that allows users to view tags across versions, books, chapters, and verses. And a website that converts USFM to USX. Lastly, a desktop app (Windows and macOS) in Go that has an embedded server communicates with a Roku ECP client to run

automated tests for the CBN Family Roku.

- Lead Roku Developer and Architect (CBN News Roku), CBN News Roku was a template Roku app, which Roku has now made its policy not to support. I designed and developed the architecture for a new app for CBN News, with BrightScript. The app is now the third-largest CBN News app, with over 20,000 users and more than 200,000 cumulative downloads.
- CBN Family Roku, I am the primary maintainer. I added multithreading to the app, which improved the startup time by a factor of 30 because the app calls various APIs, and each response contained a large payload. I optimized it to 2 seconds from 30 to 60 seconds.
- For CBN News (Android), I updated the News app from Java to Kotlin, and rewrote it in Jetpack Compose. With custom player controls and revised casting functionality, allowing users to control content being cast using the same controls seamlessly.

05/2021 - 12/2021

WPRK — Orlando, FL

Mobile Developer

Built an open-source, multi-platform radio and podcast streaming app for WPRK, a licensed FCC broadcast station

GitHub - <https://github.com/MwaiBanda/WPRK-MultiPlatform>

- Kotlin Multiplatform Mobile manages the apps' multiple targets, sharing core business logic. Using Clean Architecture with MVVM.
- Play live streams, play podcasts, and check scheduled shows for different days.
- Merged Android, iOS, and iPadOS codebases into a mono-repository with all target source code (Android, iOS, and iPadOS).

Projects

Fullstack Developer

Mometum Church - Payments & Video Streaming (Go Backend, Android, iOS & iPadOS). The backend is written in Go hosted on Google Cloud with a CI/CD pipeline and the apps are built with Kotlin Multiplatform Mobile(KMM) to emphasize code sharing with SwiftUI for iOS & Jetpack Compose for Android.

Github(Go Backend, React CMS & Swagger API Docs) - <https://github.com/MwaiBanda/Momentum-Server>

Github(Android, iOS & SDK) - <https://github.com/MwaiBanda/Momentum>

- **Stripe Integration** - to facilitate payments for **Debit/Credit, Apple Pay** or **Google Pay** I have the backend process requests from the clients apps(Android & iOS) it interacts with the Stripe API to facilitate the functionality serverside
- **Caching & Storage** - Clientside, I use an in-memory cache to store request responses and SQLite for persistent storage, then severside Redis for caching and Postgres for persistent
- **Firestore Integration** - to facilitate auth, as well as storage of store remote user data. To easy sync user data across different devices
- Available on the **AppStore & PlayStore** as '**Momentum Church: Indiana**'
